A New Way of Getting Instant Feedback on Homework

For Homework 2, we were providing feedback through unit testing on GitHub Classroom. Unfortunately, due to the time limitations implemented on GitHub Classroom, we will not be able to continue with the old system. We have a solution though, and it should be a bit easier and much faster to get feedback!

Below, we have an example of how the new system will work. Here are the key things to know:

- The format of the homework will not change. Only the feedback system will change.
- Instead of uploading to GitHub and waiting to check the unit test results, the new feedback system is built in to each problem.
- You will still upload your homework to GitHub classroom to turn it in. There just will not be a unit test for it: no red X or green checkmark will appear.
- A question answered **correctly** will output "Correct!"
- A question answered **incorrectly** will output "Incorrect"

Here is an example of what a question answered correctly will look like:

```
1 my_solution = 5
2 test_solution(my_solution, 'Problem_1')
```

```
Problem 1:
        Your solution =
                5
        Correct!
--------------------------------------------------
```

Here is an example of what a question answered incorrectly will look like:

```
1 my_solution = 6
2 test_solution(my_solution, 'Problem_1')
```

```
Problem 1:
        Your solution =
                6
        Incorrect
--------------------------------------------------
```

As with any new system, there may be other unforseen problems or questions. We will do our best to avoid bugs and problems, but please let us know what questions you have about this and we will be glad to help!
